## Fiscal Year 2008 Community Corrections Program Terminations

### **Executive Summary**

Community corrections in Colorado is a system of halfway houses that provide services to individuals diverted from a prison sentence, referred to as *diversion* clients, and those transitioning into the community from prison, referred to as *transition* offenders. This report summarizes data concerning terminations from residential community corrections halfway houses, also referred to as programs, in Fiscal Year (FY) 2008. The report describes the population served, services provided, and the successful or unsuccessful program termination status of offenders in the 35 residential community corrections programs in Colorado. A total of 2,475 diversion clients and 2,699 transition clients are included in this study.

A summary of the findings is presented here.

- Offenders in halfway houses across the state earned over \$32.6 million during FY 2008:
  - \$11,542,297 was paid in room and board;
  - \$2,010,113 was paid in federal taxes; and
  - \$822,546 was paid in state taxes.
- The majority of individuals in community corrections during FY 2008 successfully completed their placement.
  - 61.3% of diversion clients successfully completed community corrections in FY 2008, and
  - o 65.9% of transition clients successfully completed community corrections.
    - On average, transition clients were more than three years older than diversion offenders (35.9 years compared to 32.7 years, respectively), a fact that likely contributes to the higher success rate among this group.
  - Considerable variation existed in successful completion rates across programs, in part because different programs manage offenders with differing levels of severity.

- Compared to diversion clients, transition clients were more often male, African American, were older, and had a lengthier criminal history.
- Both diversion and transition clients had high needs for services, as measured by the Level of Supervision Inventory.<sup>1</sup> However, diversion offenders had statistically greater needs in the following areas:
  - Family/marital relationships,
  - Accommodation,<sup>2</sup>
  - Use of leisure time,
  - Substance abuse problems, and
  - Emotional or personal problems that interfere with functioning.
- Transition offenders had significantly greater needs on the LSI for education and employment services.
- The two populations varied little in their treatment plans. Nonetheless, diversion clients received more services in all areas with the exception of anger management.
- Treatment plans and services received were often not well matched. Approximately half of those whose treatment plan elements included employment or educational services actually received them.
- Diversion clients benefited from substance abuse treatment and cognitive restructuring
  programming. These programs significantly contributed to program success once other
  relevant factors, including criminal history, needs (as measured by the LSI), length of stay in
  the program and client age were taken into account.
  - Diversion clients scored statistically significantly higher on the Adult Substance Abuse Survey (ASUS) compared to Transition clients, on both the total score and on nearly every subscore domain, reflecting a greater need for treatment services for alcohol and drug problems.

<sup>&</sup>lt;sup>1</sup> The Level of Supervision Inventory is a 54-item assessment tool that identifies offender needs for services. The higher the score, the greater the service needs of the offender.

<sup>&</sup>lt;sup>2</sup> Higher accommodation scores result from frequent address changes, living in a high crime neighborhood, or other housing problems.

- Transition clients who succeeded in the program did not benefit from programming or services, as measured by the termination form, once criminal history, needs levels, length of stay in the program, and age were controlled for.
- Employment is a condition of residency in most community corrections programs. Employment proved to be a much more significant factor in program success than services received. Employed clients were over three times as likely to be successfully terminated as those who were unemployed.
- Client age was the most significant predictor of success, followed by offender service needs.
  - Educational status was an equally strong predictor of success for transition clients.
  - While criminal history is an important factor, this was found to be less significant than client age, LSI score, and educational attainment.
  - Clients aged 35 and over were significantly more likely to succeed than those aged 34 and under. Older diversion clients were 134 percent more likely, and older transition clients 88 percent more likely, to successfully terminate than younger clients.
  - In terms of total LSI score, diversion clients scoring under 30 were 59 percent more likely to succeed. Transition clients with an LSI score under 30 were 72 percent more likely to successfully terminate.

## The Data

Data concerning all terminations from Colorado community corrections residential programs during fiscal year (FY) 2008 was obtained by the Office of Research and Statistics from the Office of Community Corrections within the Division of Criminal Justice. The Office of Community Corrections requires program personnel to complete termination reports on all offenders leaving a community corrections program. This form collects the following pieces of information regarding the community corrections client population:

- Demographic information
- Referral source
- Juvenile and adult criminal histories
- Fiscal information
- Current crime
- Drug use
- Drug assessment scores
- The four most important objectives of the supervision plan based on the individual's Level of Supervision Inventory (LSI) score
- Services received while in the program
- Reason for termination.

An example of the termination form can be found in Appendix A. Appendix B provides an example of the LSI.

## **Description of the Community Corrections Population**

A total of 5,174 terminations from Colorado community corrections programs occurred during FY 2008. Demographic information by legal status for this population is presented in Table 1.

Transition clients were more often male, African American, and were older than diversion clients. Almost a fourth (22.4 percent) of diversion clients were female, compared to only 19.5 of transition clients. Almost 60 percent of diversion clients were white, compared to 52.4 percent of transition clients. Conversely, 21.0 percent of transition clients were African American, compared to only 13.1 percent of diversion clients.

Over half of both client types were single, and almost 80 percent were employed full-time at termination from the program. Significantly more transition clients had a high school diploma or a GED than diversion clients (62.6 percent compared to 55.6 percent). Many of the transition clients may have obtained their GED while serving time in prison prior to placement in community corrections. Nevertheless, approximately one quarter of each of these client groups had less than a high school degree or equivalent, reflecting an important need for educational services for many of these offenders.

Not surprisingly, transition clients were significantly older than diversion clients. In FY 2008 the average age of the transition population was 35.9 years, compared to 32.7 years for the diversion population. The age difference is likely due to the years that the transition offenders spent in prison. The two groups had identical *total* Level of Supervision (LSI)<sup>3</sup> average scores, representing a similar need among those in both groups for programs and services. Transition clients had significantly higher average criminal history scores<sup>4</sup> than did diversion clients. This means that transition offenders, not unexpectedly, had more extensive criminal histories than did diversion clients.

Table 2 displays the most serious conviction crimes for which these clients were placed in community corrections programs. As shown, a conviction for controlled substances was the

<sup>&</sup>lt;sup>3</sup> The Level of Supervision Inventory (LSI) is a 54-item risk and needs assessment and is a component of the

Standardized Offender Assessment (SOA). Higher scores indicate a higher need for services and supervision. <sup>4</sup> The ORS Criminal History Score is an index of an offender's past adjudications, convictions, placements and revocations. Collapsed scores range from 0 to 4, with 0 representing virtually no prior involvement in crime and 4 reflecting very serious offending histories. See K. English, M. Mande. "Community Corrections in Colorado: Why Do Some Succeed and Others Fail?" Colorado Department of Public Safety, Division of Criminal Justice, 1991.

most common for both diversion and transition offenders (37.2 percent and 34.3 percent, respectively). Theft and burglary were the second most common for both types of clients, with 28.3 percent of diversion and 23.8 percent of transition clients having been convicted of these crimes. The third and fourth most common conviction crimes for diversion clients were forgery or fraud (9.1 percent) and assault (6.1 percent). In the case of transition offenders, assault was the third most common (9.8 percent), followed by escape, at 6.0 percent.

### **Program Outcome**

#### **Financial Outcomes**

As can be seen in Table 3, offenders in halfway houses across the state earned over \$36.2 million during FY 2008 and paid over \$11.5 million in room and board. In addition, \$2.8 million was paid in state and federal taxes.

Minor differences were found between diversion and transition clients in the average amounts paid and owed at the time of termination. The difference in restitution owed was significant: transition offenders owed approximately twice that of diversion offenders. On average, diversion clients paid slightly more taxes and child support than transition clients. Finally, transition clients owed more money to the program for services received than did diversion clients at termination. Community corrections clients paid over \$11.5 million toward their room and board, and paid over \$2.8 million in state and federal taxes while in the program.

	Diversion	Diversion Transition	
Earnings	\$15,825,467	\$16,831,069	\$32,656,536
Room and Board	\$5,715,194	\$5,827,103	\$11,542,297
State Taxes	\$987,988	\$1,022,125	\$2,010,113
Federal Taxes	\$391,412	\$431,134	\$822,546

Room and Board Paid	\$2,339	\$2,189
Paid for Treatment	\$384	\$293
Owed to Program at Termination	\$342	\$319

\* Monetary difference between diversion and transition clients was significantly different (p < .001).

#### **Program Terminations**

Table 5 contains the termination status by fiscal year for clients discharged between FY 2000 and FY 2008. Clients transferred to another program are excluded from this table.

The majority of terminations from community corrections programs in FY 2008 were successful, with 61.3 percent of diversion and 65.9 percent of transition clients terminating successfully. More diversion clients were terminated due to escape and technical violations than were transition clients. Just over 3 percent of either client type was terminated with a new crime.

As shown in Table 5, transition clients were more likely than diversion clients to successfully complete community corrections. In recent years, the increase in successful completion rates is clearly the result of noteworthy decreases in escapes and technical violations among the transition population. Terminations resulting from a new crime have consistently remained at approximately 3 percent for both diversion and transition programs since 2005. Successful completion rates have improved over the past four years. Successful completion rates for diversion offenders have increased from 50.7 percent in FY 2005 to 61.3 in FY 2008. Transition program successful completion rates increased from 58.8 percent in FY 2005 to 65.9 percent in FY 2008

Fiscal Year	Successful Completion	Technical Violation	Escape	New Crime	N
		<b>Diversion Pro</b>	grams		
2008	61.3%	23.3%	12.0%	3.4%	2381

#### Table 5. Program Termination Status Over Time: FY 2000-2008

Note: Excludes those whose termination reason was the transfer to an intensive residential treatment program.

#### **Outcomes by Program**

Figures 1, 2 and 3, below, display the rate of successful terminations, the proportions terminated for escape, and the average criminal history score (see right axis for score range) for each of the 35 community corrections programs reporting in FY 2008 (see Appendix C for information regarding the names and locations of specific programs). Figures 1 and 2 display this information for diversion and transition clients, respectively, and Figure 3 combines the outcomes of these two client populations. Table 6 gives the percentages of successful terminations, escapes, technical violation and new crime terminations, along with mean criminal history scores by program for diversion clients only. Table 7 gives this same information for transition clients only, while Table 8 combines the termination and criminal history data for the two client populations.

## **Client Needs**

The average Level of Supervision (LSI) *total* scale scores for transition and diversion offenders were almost identical across the two groups of offenders. The LSI is a 54-item needs assessment instrument that measures problems in ten domains, or subscales, identified in Table 9. However, the subscales of the LSI revealed significant differences in the needs levels of the two populations. As shown in Table 8, in FY 2008 transition clients scored higher on average in the criminal history and education/employment domains. Diversion clients scored higher in the domains of family/marital, accommodation, leisure/recreation, alcohol/drug, and emotional/personal. Likewise, diversion clients scored higher on global Adult Substance Use Survey (ASUS) scores as well as on almost every domain within the survey (see Table 10).

	Diversion Average (N=2433)	Transition Average (N=2658)	Scale Range
Total	27.1	27.1	0-51
Criminal History*	2.6	3.0	0-10
Education/Employment*	5.2	5.5	0-10
Financial	1.0	1.0	0-2
Family/Marital*	1.8	1.7	0-4

Table 9. Level of Supervision Inventory Scores: FY 2008 Community Corrections Terminations

\* P<.001

Source: Community Corrections termination data provided by the Division of Criminal Justice Office of Community Corrections and analyzed by the Office of Research and Statistics.

In terms of elements included in treatment plans, diversion and transition populations varied only in that greater proportions of diversion clients were anticipated to address accommodation issues (13.5 percent vs. 10.6 percent) and leisure/recreation issues (39.0 percent vs. 34.5 percent). As shown in Table 11, the service most commonly included in treatment plans was alcohol and drug services, which were included in over three-quarters of the treatment plans. Education and employment were included in half of all treatment plans, and issues concerning companions were to be addressed for approximately 44 percent of all clients.

	Diversion	Transition	Scale

## **Services Received**

As can be seen in Figure 4, substance abuse services were provided to the majority of clients, with 73.8 percent of diversion and 67.6 of transition clients receiving such treatment. Cognitive restructuring was the second most commonly administered service, with approximately half of all terminations receiving this service.

Employment and vocational services were provided to 40.2 percent of diversion and 38.1 percent of transition terminations. Just over 30 percent of both populations received life skills and financial services. Anger management was the next most frequently Treatment plans and services received were often not well matched in the case of employment, education, financial skills and mental health needs. However, the majority of those with substance abuse problems did receive treatment.

provided program, with 13.2 percent of diversion and 19.5 percent of transition clients participating. Closely following were education and mental health services, received by 15.5 percent and 14.7 percent of diversion and transition offenders, respectively. Sex offender and domestic violence services were provided to only small percentages of diversion and transition offenders, at 2.5 percent and 6.7 percent, respectively.

Diversion clients typically received services of all types more often than did transition clients. The exception to this is in the area of anger management. A significantly greater proportion of transition clients received anger management than did diversion clients (19.5 percent compared to 13.2 percent).

Treatment plans and services received were often not well matched. As shown in Table 12, approximately half of those whose treatment plan elements included employment or educational services actually received them. Only 29.8 percent of diversion clients and 33.6 percent of transition clients whose treatment plan included financial skills did receive related services, and a third of those who needed assistance with financial skills or mental health services received these services.

However, the majority of those needing substance abuse treatment did receive it. Of clients in need of such services, 81.0 percent of diversion and 73.8 percent of transition clients received them. The correspondence between treatment plan elements and services received is graphically displayed in Figures 5 and 6. Tables 13 and 14 display the correspondence between treatment plans and services received by program, for diversion and for transition programs separately. *It is important to note that no data beyond individual program audits exist to determine the quality of services given or if clients completed their program.*

### **Factors Affecting Program Success**

The following discussion examines the association between client characteristics and successful termination from a community corrections program. Terminations for technical violations, new crimes and escape are considered to be unsuccessful. Terminations in which clients were transferred to intensive residential treatment are excluded from this analysis.

Many factors are found to be significantly associated with successful termination. Among these, as shown in Table 15, are employment status, educational achievement, length of stay in the program, risk and service needs as measured by the LSI, criminal history, and client age. It was found that clients aged 35 and over , and those scoring under 30 on the LSI were significantly more likely to succeed.

Since employment is a condition of placement in most programs, it is not surprising that employment has consistently been found to be linked to program success in community corrections (Woodburn & English, 2002; Burrell & English, 2006).<sup>5</sup> In FY 2008, 78.3 percent of diversion terminations and 79.7 percent of transition terminations were employed full time when they left the program. Overall, the odds of employed clients succeeding is 7.5 times that of unemployed clients. Additionally, since clients who fail are generally quickly terminated from the program, length of stay is clearly associated with success.

Logistic regression<sup>6</sup> was applied to determine the importance of these client characteristics in program success, while holding the obvious predictors of employment status and length of stay in the program constant. In the case of both the diversion and transition populations, age proved to be the most significant predictor of success, followed by offender risk and service needs as measured by the LSI. Educational status was an equally strong predictor of success for transition clients, though this was found to be less significant for the diversion population. While criminal history is an important factor, this was found to be less significant than client age, LSI score , and educational attainment (see table 16).

<sup>&</sup>lt;sup>5</sup> Additionally, clients are required to pay room and board, which is dependent upon employment. An exception to this rule occurs with the Fillmore facility of Independence House, which specializes in serving clients with mental illness. This halfway house does not require their residents to work, which may contribute to its relatively high successful termination rates and low technical violation rates (see Table 6).

<sup>&</sup>lt;sup>6</sup> Logistic regression was applied in this analysis. This statistical tool can be used in to predict program outcomes based on the values of a set of predictor variables such as criminal history, LSI score, length of stay and client age. Logistic regression can also be used to estimate odds ratios which measure of the odds of an event (such as successful program discharge) occurring for one group (such as those receiving services) compared to the odds of the same event happening in another group (such as those not receiving services).

		Legal status				
		Diversion (N=8,194)* Transition (N=7,636

Table 15. FY 2008 Community Corrections Terminations: Program Outcome by ClientCharacteristics

\* All differences between successful and unsuccessful termination are statistically significant at p<.001, with the exception of average criminal history score, for which this difference is significant at p<.01.

\*\* All differences are statistically significant at p<.001, with the exception of educational status, for which this difference is significant at p<.01. Source: Community Corrections termination data provided by the Division of Criminal Justice Office of Community Corrections and analyzed by the Office of Research and Statistics.

The odds ratios given in Table 16 indicate that the probability of success increases with client age, by 5 percent per year for diversion clients and by 4 percent per year for transition clients. Likewise, the probability of success decreases with increasing LSI scores. The likelihood of a successful termination decreases by 3 percent with each incremental increase in a diversion client's LSI score, and by 4 percent in the case of transition clients. Having a high school diploma or a GED increases the probability of success by 37 percent for diversion clients. Having a diploma or a GED is particularly beneficial for transition clients, increasing their probability of success by 74 percent.

Given the relevance of client age and LSI score in program outcomes, further analysis was undertaken to identify more specifically clients most likely to successfully complete community corrections. It was found that clients aged 35 and over were significantly more likely to succeed than those aged 34 and under. Older diversion clients were 134 percent more likely, and older transition clients 88 percent more likely, to successfully terminate than younger clients. In terms of total LSI score, diversion clients scoring under 30 were 59 percent more likely to succeed. Transition clients with an LSI score under 30 were 72 percent more likely to successfully terminate.

#### Table 16. FY 2008 Community Corrections Terminations: Impact of Client Characteristics on **Successful Termination**

### **Services and Outcome**

Analyses were conducted to determine the impact of the services received on program outcome, while holding constant those client characteristics found to be associated with outcome. These characteristics include criminal history, client needs (as measured by the LSI), length of stay in the program, and client age (see footnote 6). Table 17, below, provides the odds ratios which describe the extent of the relationship between program participation and successful termination after controlling for these factors.

Diversion clients were significantly more likely to successfully terminate from community corrections when they participated in substance abuse treatment and cognitive restructuring programming. Compared to offenders who did <u>not</u> receive these services, diversion offenders participating in substance abuse programming were 1.8 times as likely to successfully terminate from the halfway house, and those participating in cognitive restructuring programs were 1.4 times as likely as to successfully terminate from the halfway house. However, this was not the case with transition clients. None of the service types examined were found to impact program success for transition clients once criminal history, LSI score, length of stay and client age were taken into account. In other words, overall, programs and services as *measured by the information available in the termination form* were less influential to case outcome than these specific characteristics of individual clients.

### Table 17. FY 2008 Community Corrections Terminations:Impact of Services Received on Successful Termination

## Summary

The differences between diversion and transition community corrections clients are notable. Transition clients are more often male, African American, and are older than diversion clients. Though they present with identical average LSI *total* scores, transition clients have significantly higher criminal history scores than do diversion clients.

Transition clients tend to terminate from community corrections successfully more often than division clients (65% vs. 59%). A great deal of variation exists in successful completion rates across programs.

Diversion clients tended to present with greater needs than did transition clients as demonstrated by LSI subscales and ASUS scores. However, the two populations varied little in their treatment plans. Nonetheless, diversion clients received more services in all areas with the exception of anger management, a program more frequently used by transition offenders.

The provision of services was linked to successful termination from community corrections for diversion clients. Diversion offenders who participated in substance abuse treatment and cognitive restructuring were more often discharged successfully than were those not participating in these services. However, once other relevant factors including criminal history, needs (as measured by the LSI), length of stay and client age were held constant, only substance abuse treatment and cognitive restructuring remained significant contributors to program outcome for diversion clients only. No services were significantly linked to program outcome in the cases of transition clients once these same factors were controlled for in the analysis. This finding likely reflects the inability of the items on the termination form to capture the external elements that contribute to the success of transition clients.

In terms of client characteristics, employment is the most significant factor in program success. This is not surprising since employment is generally a condition of living in a halfway house. An exception to this may occur in facilities where employment is not a condition of program participation, as in the case of the Fillmore branch of Independence House.

Holding employment and length of stay in the program constant, criminal history, needs (as measured by the LSI), client age and educational status all contribute to success. The most significant of these is age, with the probability of success increasing along with the age of the client. It was found that clients aged 35 and over were significantly more likely to succeed than younger clients. The older diversion clients were 134 percent more likely, and older transition clients 88 percent more likely, to successfully terminate than younger clients.

Client needs are the second most important factor among those examined, with the probability of program failure increasing along with client needs, as measured by the LSI. Clients scoring under 30 were between 59 percent (in the case of diversion clients) and 72 percent (in the case of transition clients) more likely to successfully terminate.
